Globalization, Industrialization Social Issues and Environment Situation in India

Anil Kosamkar

Associate Professor Dept. of Sociology Dr.L.D.Balkhande College of Arts and Commerce Pawani

Abstract

Globalization has led to an increase in the consumption of products which has impacted the ecological cycle. Increased consumption leads to an increase in the production of goods which in turn puts stress on the environment. Globalization causes rise in pollution level. The amount of fuel that is consumed in transporting these products has led to an increase in the pollution level in the environment. Globalization has also led to several other environmental conscience such as noise pollution and landscape intrusion. Transportation has also put a strain on the non-renewable sources of energy, such as gasoline. It also causes depletion of ozone layer. Industrialization developments give rise to round house gases which include carbon dioxide and methane. The content of carbon dioxide in the air and temperature are rising. Earth is not appropriate for human being to live any mole. The impact of industrialization on the environments has led the way with certain positive and large negative outcomes among environment. There are quite a number of resourceful natural elements like water, air, soil and fisheries.

Environment commonly refers to the surroundings in which all living and non-living things reside and establish a sense of attraction with one another. These include air, water, soil, human beings, animals etc. However being a part of the city, town or village, we observe that the environment around us digitally a neutral landscape, for instance, a desert, a forest even a river that has been shelled by humans for buildings, loads and factories.

(Key Words- Environment, issues, application, strategy, administration, planning's etc)

Introduction

According to studies it has been found the industries have greatly affected the environment. The emission of CO₂ has increased which has led to greenhouse effect. In recent years it has been found a hole in already been created in the ozone, layer which has led to direct entry of radiation on the surface of earth which can cause skin cancer and other disease.

Protection for Environment

- We need to protect environment from the industries. The fast growth of industries is now leading to great environmental damage.
- Like a famous example Bhopal gas tragedy of 1984 is the clear example of environmental damage done to environment and amount of damage it has done to human life.

Eco - Industrial development

- Eco - industrial development is a framework for industry to develop while reducing its impact on environment. Thus helping to develop better environment.
- It uses closed loop production cycle to tackle burred set of environmental challenges such as soil and water, pollution deforestation etc.
- The approach itself is largely voluntary and market driven but often pressed ahead by favorable government treatment efforts of development co-operation.

Ways of protecting Environment from the Industrial development

1) Use of public transport

- If start using public transport instead of any personal vehicle it will definitely help to reduce pollution.
